

NAME

syslog – Write messages to the system logger.

SYNOPSIS

syslog *level message*

DESCRIPTION

The **syslog** command allows a Tcl script to write a *message* to the system logger. Further processing of the message depends on the priority *level* of the message and the configuration of the system message logging daemon. Allowed priority levels are:

emergency	A panic condition. This is normally broadcast to all users.
alert	A condition that should be corrected immediately, such as a corrupted system database.
critical	Critical conditions, such as hard device errors.
error	Errors messages.
warning	Warning messages.
notice	Conditions that are not error conditions, but that may require special handling.
info	Informational messages.
debug	Messages that contain information normally of use only when debugging a program.
